

Server Installation for Neo4j 2.1.6

Neo4j software consists of the database server software only. There is no client software. The interface to the server is either programmatically or using the database browser in a Web Browser (Firefox, IE, etc.). Neo4j uses Oracle 7 or higher.

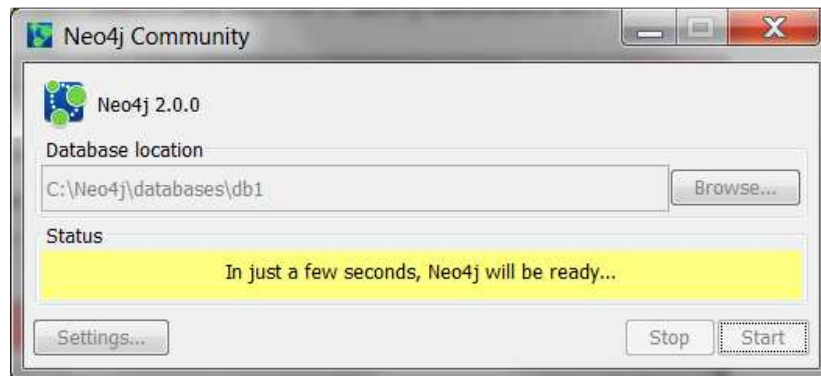

1. Create a directory on the c:\ drive called "neo4j"
2. Create a sub-dir called "databases" in c:\neo4j. (You will now have c:\neo4j\databases directory structure). We will use this as the path for our databases.
3. In databases directory, create another sub-dir called "db1".
4. Download Neo4j 2.0 Community edition for Windows 64 bit from www.neo4j.com and save the .exe file (typical download directory is user's download directory.)
5. Double click the executable in you just downloaded to install the server software.
6. Follow the steps and accept all default location, etc.
7. At the last step, the installer asks to start the server. Click "Yes".
8. The following dialog opens

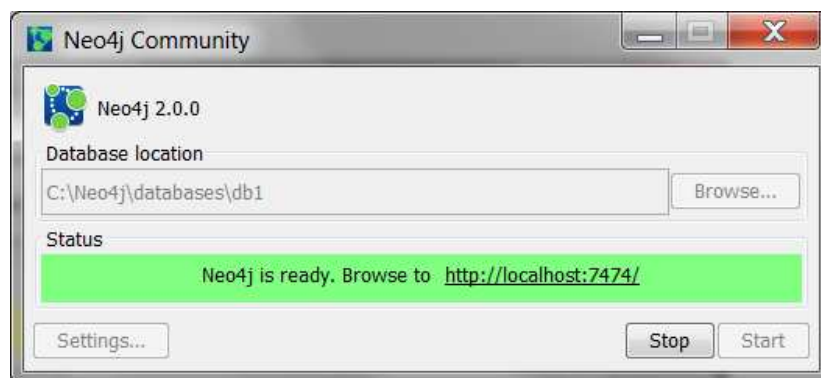

9. Click on the Browse... button and choose c:\neo4j\databases\db1

10. Click "Start"

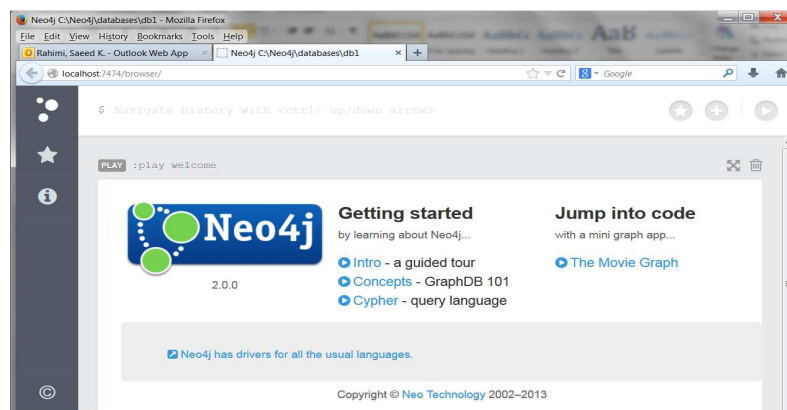

11. After a few seconds, the database will be set and the server is ready to be used.

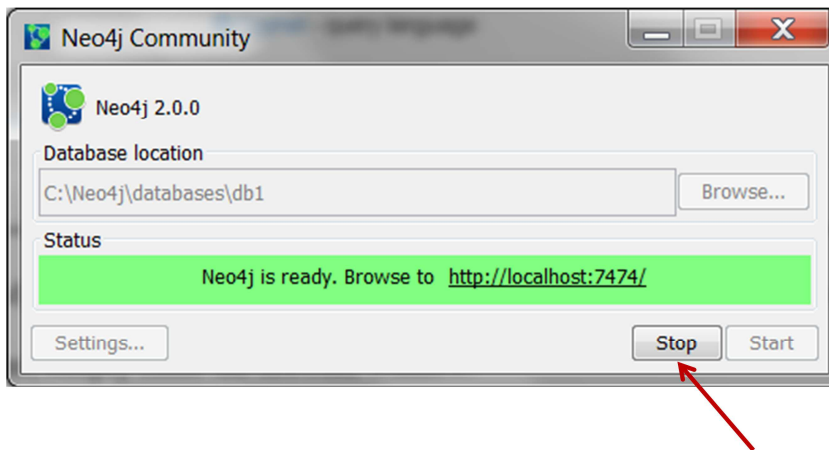

12. Shrink this dialog and leave it alone for now.

Starting the client:

1. Open up Firefox
2. For the URL type "localhost:7474" and press "Enter"
3. The following page opens

4. You are now ready to use Neo4j's database management system using Cypher as the query language.
5. To close the client, simply close the browser window.
6. **Important:** After you are done with the database, you need to **stop** the server by clicking on the "Stop" button. Do not just close the server window since you will damage your database.

7. After you have stopped the server and need to re-start it again, go to "All Programs" and choose "Neo4j Community" from the programs sub-menu. Follow the steps for choosing the database path, etc.
